

Resources Management using ERP- an efficient way to plan and optimize results.

February 2022 Edition

Managing resources efficiently in a business is a very important aspect. Without proper resources management the business can go haywire. It is not always the quantity of the resources but the management of these resources that define the productivity of the business. This requires taking appropriate management decisions at the right time.

However, for this, analysis of data is required. ERP software is one of the most appropriate tools for this. Given the correct data it gives the user the desired reports and analysis based on which decisions can be made. The reports and analysis vary from industry to industry, which can be incorporated in the ERP.

An ERP gives you the ability to have a bird’s eye view of the entire resources by bringing all the different business functions on a common platform. There are various ways to identify the resources and mapping them, be it humans, machines, raw materials and other resources.

One of the best provisions that an ERP provides is the customizations according to the needs of the businesses. For example: if a business is looking to organize its inventory, reports and inventory management functions can be customized for them. Reports are one of the most utilitarian functions that give effective analysis for making appropriate management decisions.

A glimpse of how we helped clients in resource management with our solution:

Steel Emporium is a stockist and dealer of stainless steel accessories. We helped them for maintaining their raw materials and stock with the below features

- Helping them to make timely delivery of goods as per schedule
- Making appropriate purchase of goods based on available stock
- Tracking of goods lying with third party vendors
- Increase profits due to maintenance of optimum stock levels

Associated Coaters is a powder coating service company. We customized and implemented the BizERP software for their material management and data analysis needs:

- Tracking of materials received from clients
- Tracking delivery as per schedule
- Tracking Cost and profit against each shipment
